ScriptRunner for Confluence

Automate Confluence the way you want

Take advantage of a wide range of automated admin features like the ability to change a content author on multiple pages, build your own automations based off events in Confluence, or add functional items to UI elements.

Improved content management

Gain a better understanding of content with space statistics. Control content with bulk automations such as bulk delete attachments and automate tasks like archiving or removing large attachments with script jobs.

Make content more powerful and discoverable

Build more powerful content with built-in macros or write your own bespoke macros for your teams. Write detailed CQL queries and display results on Confluence pages, and better manage page labels.
